ALIGNMENT INSTRUCTIONS

Read These Instructions With Extreme Care Before Attempting Alignment.

CHASSIS. Turn the TUNING knob completely counterclockwise without forcing. Dial pointer should be at zero index mark on logging scale. If not, reset the dial pointer. Disconnect the external antenna. When using an oscilloscope for alignment, set the AUDIO LEVEL control for no overload, as shown by the proper waveform shape. Set remaining controls as follows: SELECTOR, MONO, MUTING, OFF; AFC, OFF; SENSITIVITY, DISTANT; ANTENNA SELECTOR (on rear panel), 300.

SIGNAL GENERATOR: The signal generator equipment must be able to supply RF ± 22.5 KC deviation at 400 cps.

INDICATOR: DC VTVM, and scope for alignment.

ALIGNMENT: Allow the chassis and test instruments to warm up for at least 15 minutes. Adjust the line voltage for 117 volts AC, 50-60 cps. Use fully insulated tools: a small screwdriver for all trimming capacitors; a K-tran tool for Z1, Z2, Z3; a hex tool for Z4, Z5, Z6, L3, L9, L25, L10, and L14.

- NOTES:**
- 1—For accurate alignment, signal generator output voltage must be adjusted to produce meter readings within the range specified in the INDICATION column for each step.
 - 2—Signal generator frequency should be held constant for IF, limiter, and ratio detector alignment (Z1 through Z6).
 - 3—If adjustment of muting oscillator is necessary, adjust L14 for 3MC oscillation using a grid-dip meter.
 - 4—Do not tamper with adjustments on multiplex sub-chassis. These circuits are extremely stable and should require no service other than tube replacement, which does not affect alignment. Multiplex alignment requires special test equipment which will be available in the near future. If servicing is required, write to:
