INTRODUCTION

The N4416 is a 3-speed, 4-track stereo reel-to-reel recorder which can be used both in the horizontal and in the vertical position. The recorder is suitable for mono and stereo recording and playback, multiplay, duoplay and mixing during recording. The amplifier has an output power of 2x4 W ($d < 5\%$) and incorporates acoustic loudspeaker enclosures. Operation is by means of push-buttons. The recorder is equipped with 2 heads (recording/playback head and erase head). Three motors are used: one electronically controlled d.c. motor which drives the capstan and two d.c. motors for fast winding and driving the turntables. Furthermore, the recorder features a counter with zero reset button and automatic stop facility in position "0000", automatic stop at the end of tape and tape tension controls for uniform take-up during fast winding. The audio section and the control section employ plug-in p.c. boards, so-called functional units. Moreover, it is possible to use a continuous tape cassette and to connect headphones and remote control unit N6718.

TECHNICAL SPECIFICATION

Mains voltages	: 110 - 127 - 220 - 240 V
Mains frequency	: 50-60 Hz (no adaptation necessary).
Power consumption	: 40 W
Number of tracks	: 4
Tape speeds	: 4.75 cm/sec ($1\frac{7}{8}$ i.p.s.) \pm 2% 9.5 cm/sec ($3\frac{3}{4}$ i.p.s.) \pm 1% 19 cm/sec ($7\frac{1}{2}$ i.p.s.) \pm 1%
Max. reel diameter	: 18 cm (7")
Number of heads	: 2 (1 recording/playback head, 1 erase head)
Number of motors	: 3 (1 d.c. motor for capstan drive, 2 d.c. motors for driving the turntables)
Wow and flutter at:	
4.75 cm/sec. ($1\frac{7}{8}$ i.p.s.)	: ≤ 0.35 %
9.5 cm/sec. ($3\frac{3}{4}$ i.p.s.)	: ≤ 0.2 %
19 cm/sec. ($7\frac{1}{2}$ i.p.s.)	: ≤ 0.15 %
Winding time for an 18 cm (7") reel with LP tape (540 m)	: ≤ 180 secs.
Input sensitivities:	
micro	: 0.2 mV/ > 2 k Ω
tape	: 2 mV/ 20 k Ω
phono	: 100 mV/ $1M\Omega$
Output voltages:	
tape	: 1 V/ > 50 k Ω
headph	: 3 V/400 - 600 Ω
Output power	: 2×4 W ($d < 5\%$ - 8 Ω)
Frequency range (within 6 dB)	: 4.75 cm/sec ($1\frac{7}{8}$ i.p.s.) 60 - 8000 Hz 9.5 cm/sec. ($3\frac{3}{4}$ i.p.s.) 40 - 15000 Hz 19 cm/sec. ($7\frac{1}{2}$ i.p.s.) 40 - 16000 Hz
Built in loudspeaker enclosures	: 2 x 5 litres
loudspeakers	: 8Ω (2x102x154 mm; 2 x 4" x 6") (4822 240 20108)
Erase frequency	: 100 kHz ($\pm 10\%$)
Dimensions (incl. transparent cover)	: 515x380x200 mm (20 $\frac{1}{4}$ "x15"x7 $\frac{3}{4}$ ")
Weight (incl. transparent cover)	: 10 kg (22 lbs)

INPUTS AND OUTPUTS

Indication	For connection of	Sensitivity	Impedance	Type of socket	Connections	Location
MICRO L+ST BU1	a microphone with a 3-pole 180° DIN plug for recording on every channel in position 1-4 and 3-2 and for recording on the left channel in position ST; a microphone with a 5-pole 180° DIN plug for stereo recording.	0,2 mV	> 2 kΩ	5p, 180°, DIN	 1 - left 4 - right 2 - 5 - 3 -	front
MICRO R BU101	a microphone with 3-pole or 5-pole 180° DIN plug for recording on the left channel in position ST.	0,2 mV	> 2 kΩ	5p, 180°, DIN	 1/4 - right 2 - 5 - 3 -	front
HEADPH BU5	a pair of stereo headphones	3 V	400-600 Ω	5p, sym. DIN	 1 - 2 - 3 - 4 - left 5 - right	front
LOUDSP L LOUDSP R BU4 BU104	a loudspeaker enclosure with an impedance of 8 Ω	—	8 Ω 8 Ω	2p, DIN	 1 - 8 Ω 2 -	rear
REMOTE BU7	a remote control unit N6718	—	—	5p, 240°, DIN	 1 - +20 V (via SK603) 2 - 3 - 4 - 5 - pause	rear
— BU8	testpoints	—	—	5p, 180°, DIN	 1 - testpoint 1 4 - testpoint 2 2 - 5 - 3 -	rear
PHONO BU3	a record player with X-tal cartridge	100 mV	1 MΩ	5p, 180°, DIN	 1 - right 4 - 2 - 5 - right 3 - left	rear
TAPE IN/OUT BU6	another recorder or other unit with 5-pole, 180° DIN input and output socket. Input: pins 1 and 4 Output: pins 3 and 5	2 mV 1 V	20 kΩ > 50 kΩ	5p, 180°, DIN	 1 - left 4 - right 2 - 5 - right 3 - left	rear

DISASSEMBLY (see Figs. 1, 2 and 3)

- The black covering plate can be taken off after removing the 3 screws. A. For replacing the heads, pinch roller etc. the front head cover C should also be removed. (see Fig. 1).
- To prevent vibrating of the covering plate three rubber strips E have been fitted on the rearmost ornamental frame. These must be kept in position when the covering plate is refitted. (see Fig. 2).
- After removing the 4 screws B the complete amplifier board can be hinged to the right (first it should be lifted slightly). The board can be locked in the hinged up position by means of the hook which is clamped to the bottom of the cabinet. For this, the hook is hooked into the hole in the heatsink of the output transistors (see Fig. 2).
- The tape deck remains connected to the amplifier board with a wire harness, so that the recorder can function normally. When the board is to be removed from the cabinet, the plug on one side of the tape deck should be detached. Moreover, the loudspeaker and supply voltage connections should be detached (plugged connections).
- After removing the 5 screws D the complete tape deck can be placed on end in the cabinet (see Fig. 3). For this purpose recesses have been made in the loudspeaker enclosures in which the two winding motors can rest. The tape deck now also remains connected to the amplifier board via a wire harness so that the recorder remains operative. After unplugging the plug on one side of the tape deck the complete tape deck can be lifted out of the cabinet.

Attention:

When the tape deck is removed from the cabinet, the drive belt should be taken off the counter pulley and placed round e.g. the left tape tension sensor.

Note:

If the recorder should operate again the counter belt should be free!

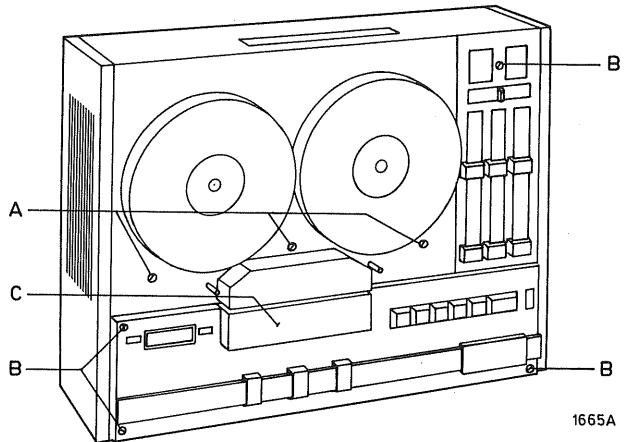

Fig. 1

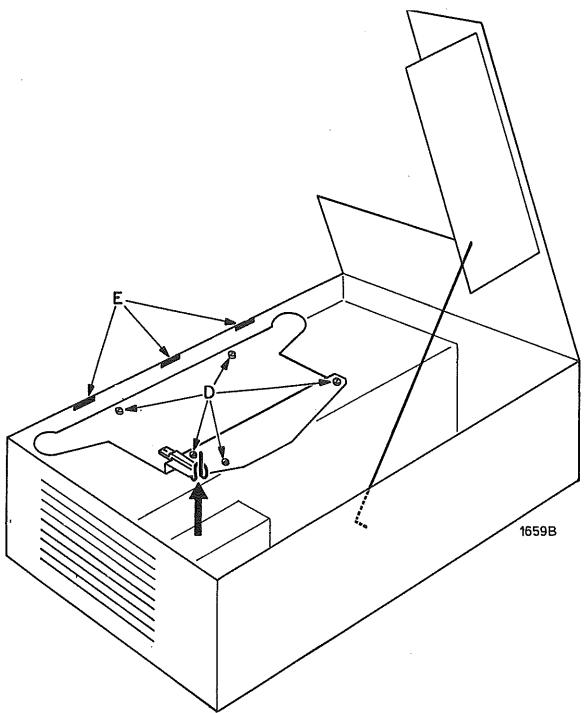

Fig. 2

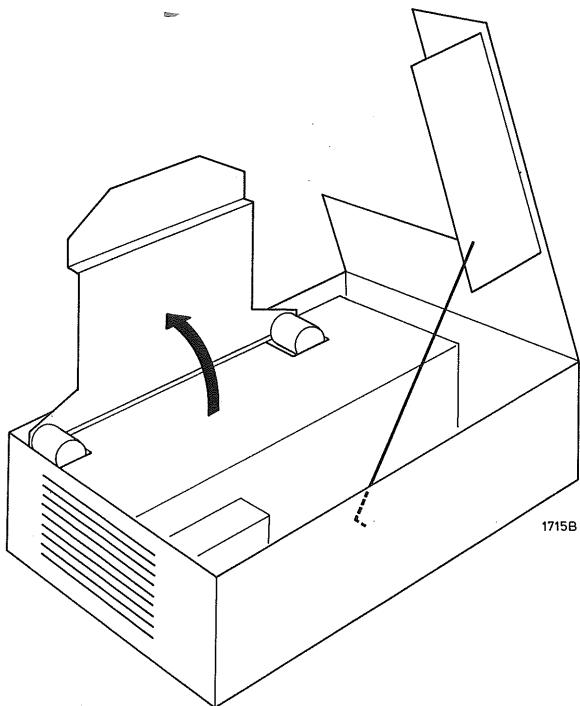

Fig. 3

REPAIR HINTS (see Figs. 4, 5, 6, 7 and 8)

- Replacing the indication strips with slide buttons (see Figs. 4 and 5).
 - Insert a screwdriver halfway the side between the panel of the slide button and the edge of the front panel or the adjacent panel and lever the panel forwards.
 - When refitting the panel first position the bottom and top into the amplifier board and then the middle piece.
 - During mounting check that the slide of the button fits over the cam of the potentiometer.

- Replacing potentiometers (see Fig. 6)
 - Remove the 2 screws A
 - Carefully bend back the plastic tags B, pull up the p.c. board and bend it to the right.
 - The potentiometers can now be unsoldered and replaced.

Note:
The indication on the potentiometers should always be located on the side with the indication "0".

- Replacing the control buttons (170 - 175) (see Figs. 7 and 8)
 - Button 175 (REW); 174 (FFORW); 170 (STOP)
 - Remove the rubber wedge 192
 - The button can now be pulled forwards out of the amplifier board.
 - Button 173 (PLAY); 172 (PAUSE)
 - Remove bracket 197 (193)
 - Remove the rubber wedge 192
 - The button can now be pulled forwards out of the amplifier board.
 - Button 171 (REC)
 - Remove the rubber wedge 192
 - Remove the 3 screws A
 - Bend bracket 205 so far back that lever 204 is disengaged from the spindle of the button.
 - The button can now be pulled forwards out of the amplifier board.

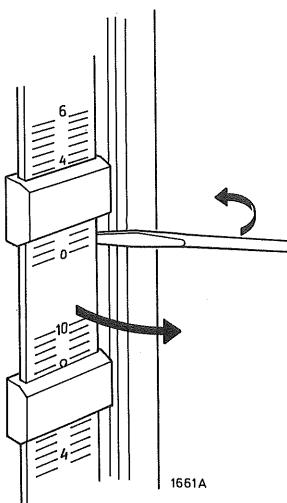

Fig. 4

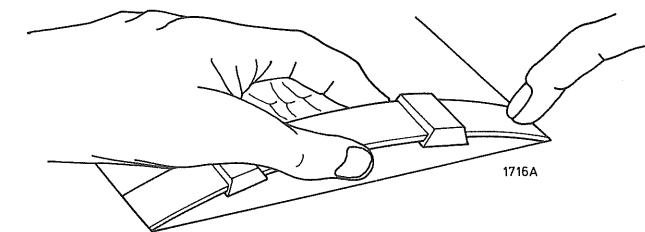

Fig. 5

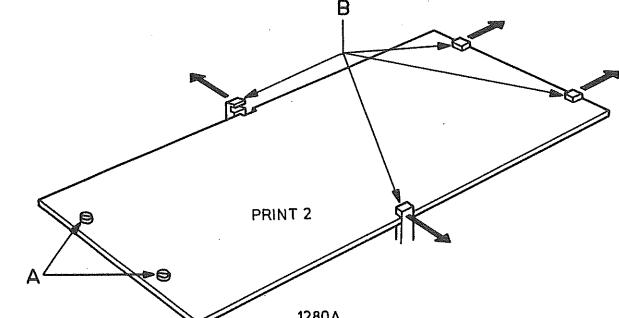

Fig. 6

- Replacing the function buttons (152) and sliding cover (176).
 - Remove rail 153 by pulling it forwards.
 - The buttons and the cover can now be slid off the rail.
 - Replacing the levers (138)
 - Remove the shouldered bolt 134
 - For the left-hand lever "1-4 - ST - 3-2" retaining ring 38 should also be removed. (see Fig. 28)
 - Tilt back the lever until it can be removed from the amplifier board.
 - Replacing switches
 - Switch "1-4 - ST - 3-2" (SK2, 3); "MP - NOR - DP" (SK5, 6); "19 - 9,5 - 4,75" (SK4)
 - Remove clamping spring 135, pin 137 and coupling piece 136.
 - The switch can now be unsoldered from the p.c. board.
 - Switch "REC" (SK1, 101)
 - Remove screw 28.
 - The switch can now be unsoldered from the p.c. board.
 - Replacing the loudspeakers
 - Remove the 3 screws in the left side or the 4 screws in the right side of the cabinet and the 3 Phillips screws in the bottom panel of the cabinet. After this, the side panels can be removed and the loudspeakers can be replaced.
 - Replacing the output transistors
 - If the output transistors are defective, it is recommended to first measure the voltages of the driver stages. This can be done after removing the defective output transistors as the voltages in the driver stages will not change without output transistors. Only after ascertaining whether these voltages are correct, the new output transistors may be fitted.

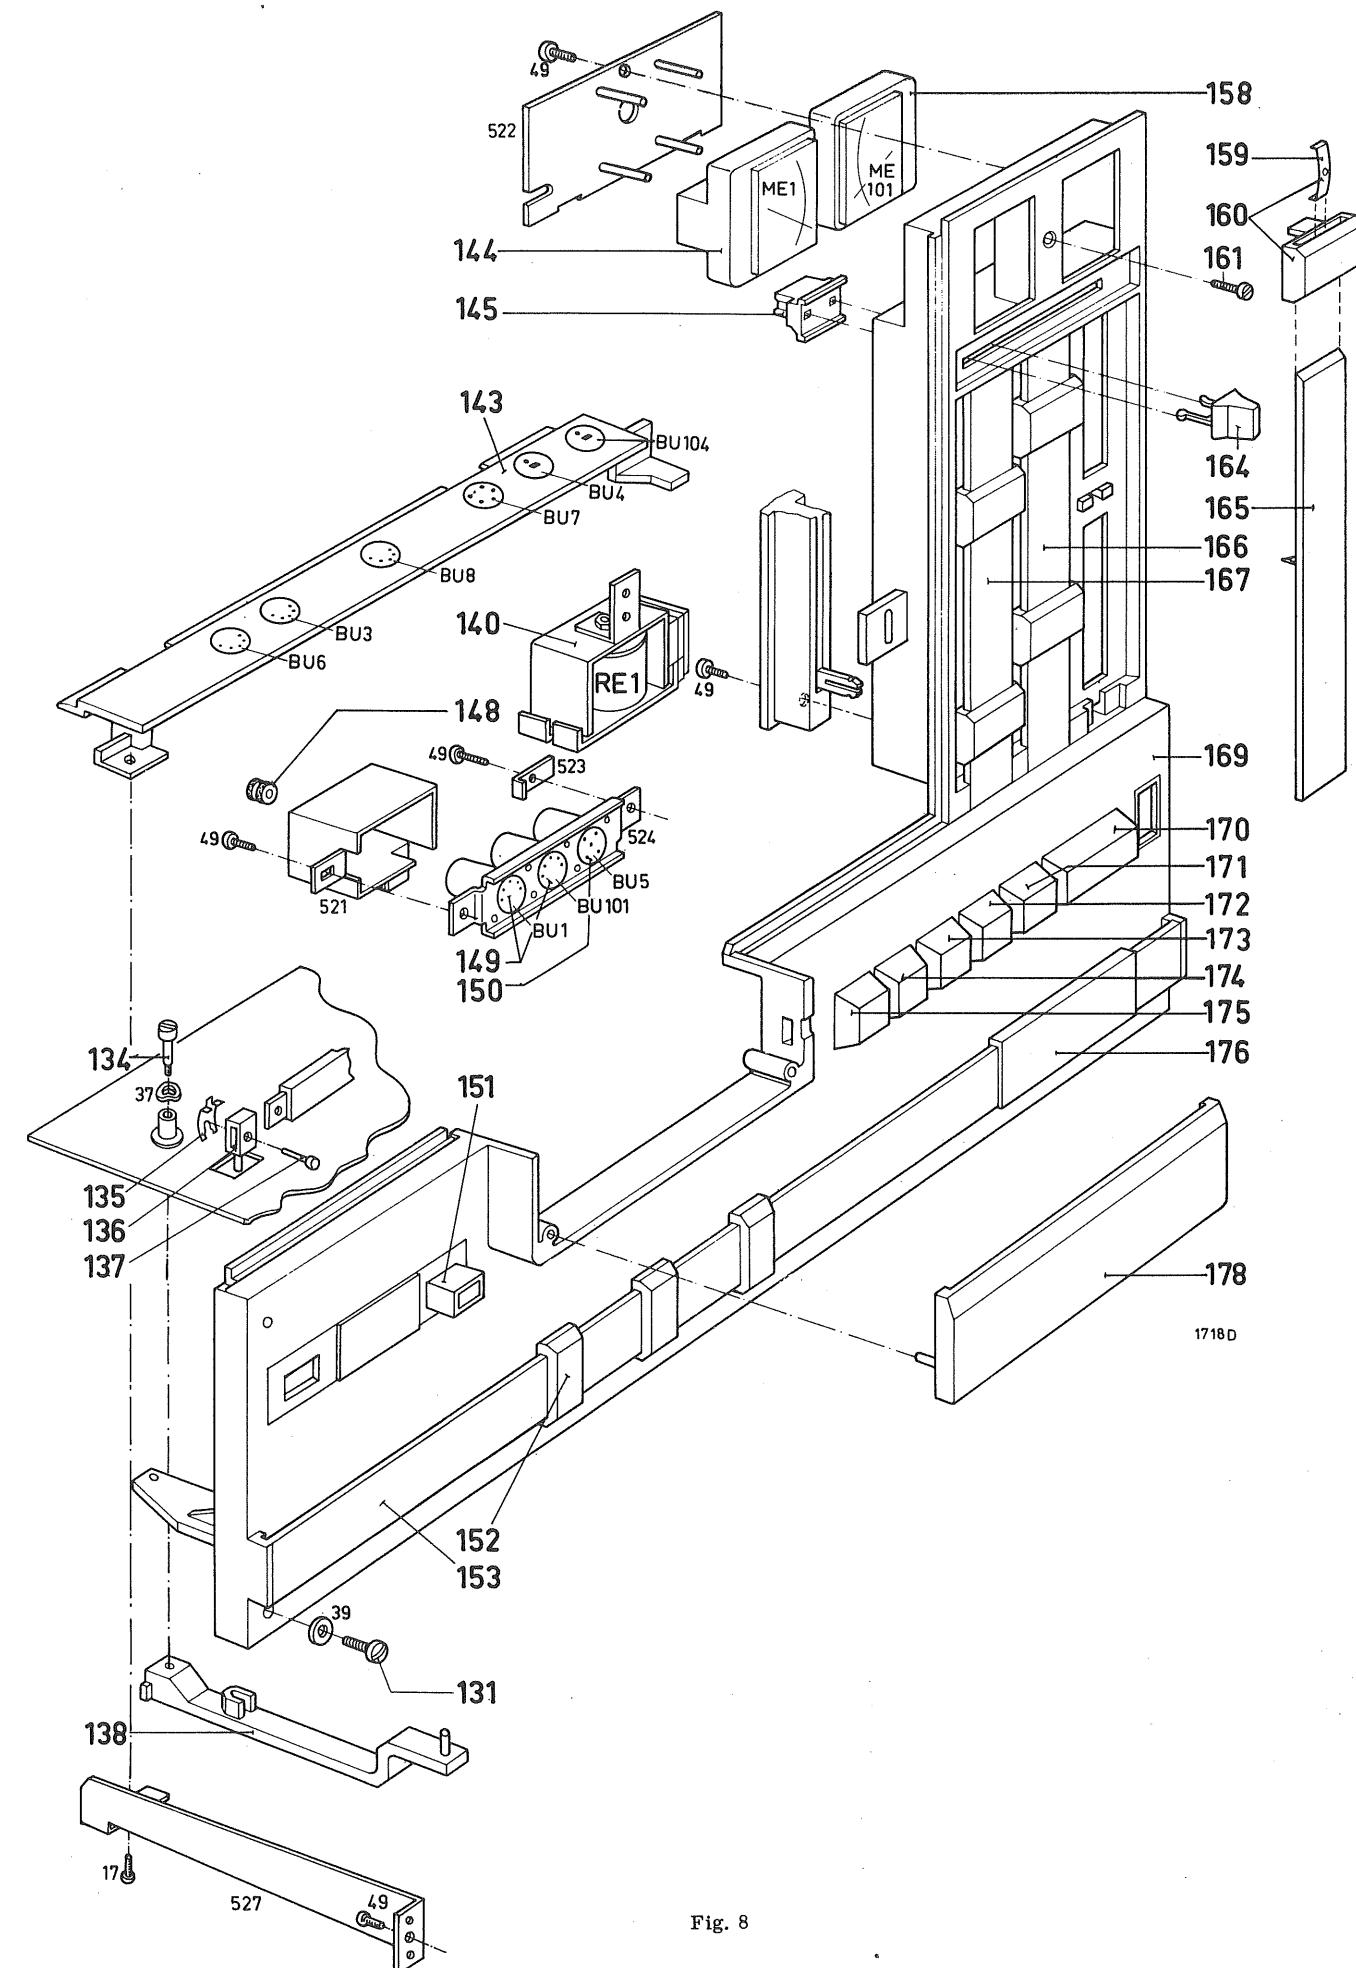

Fig. 8

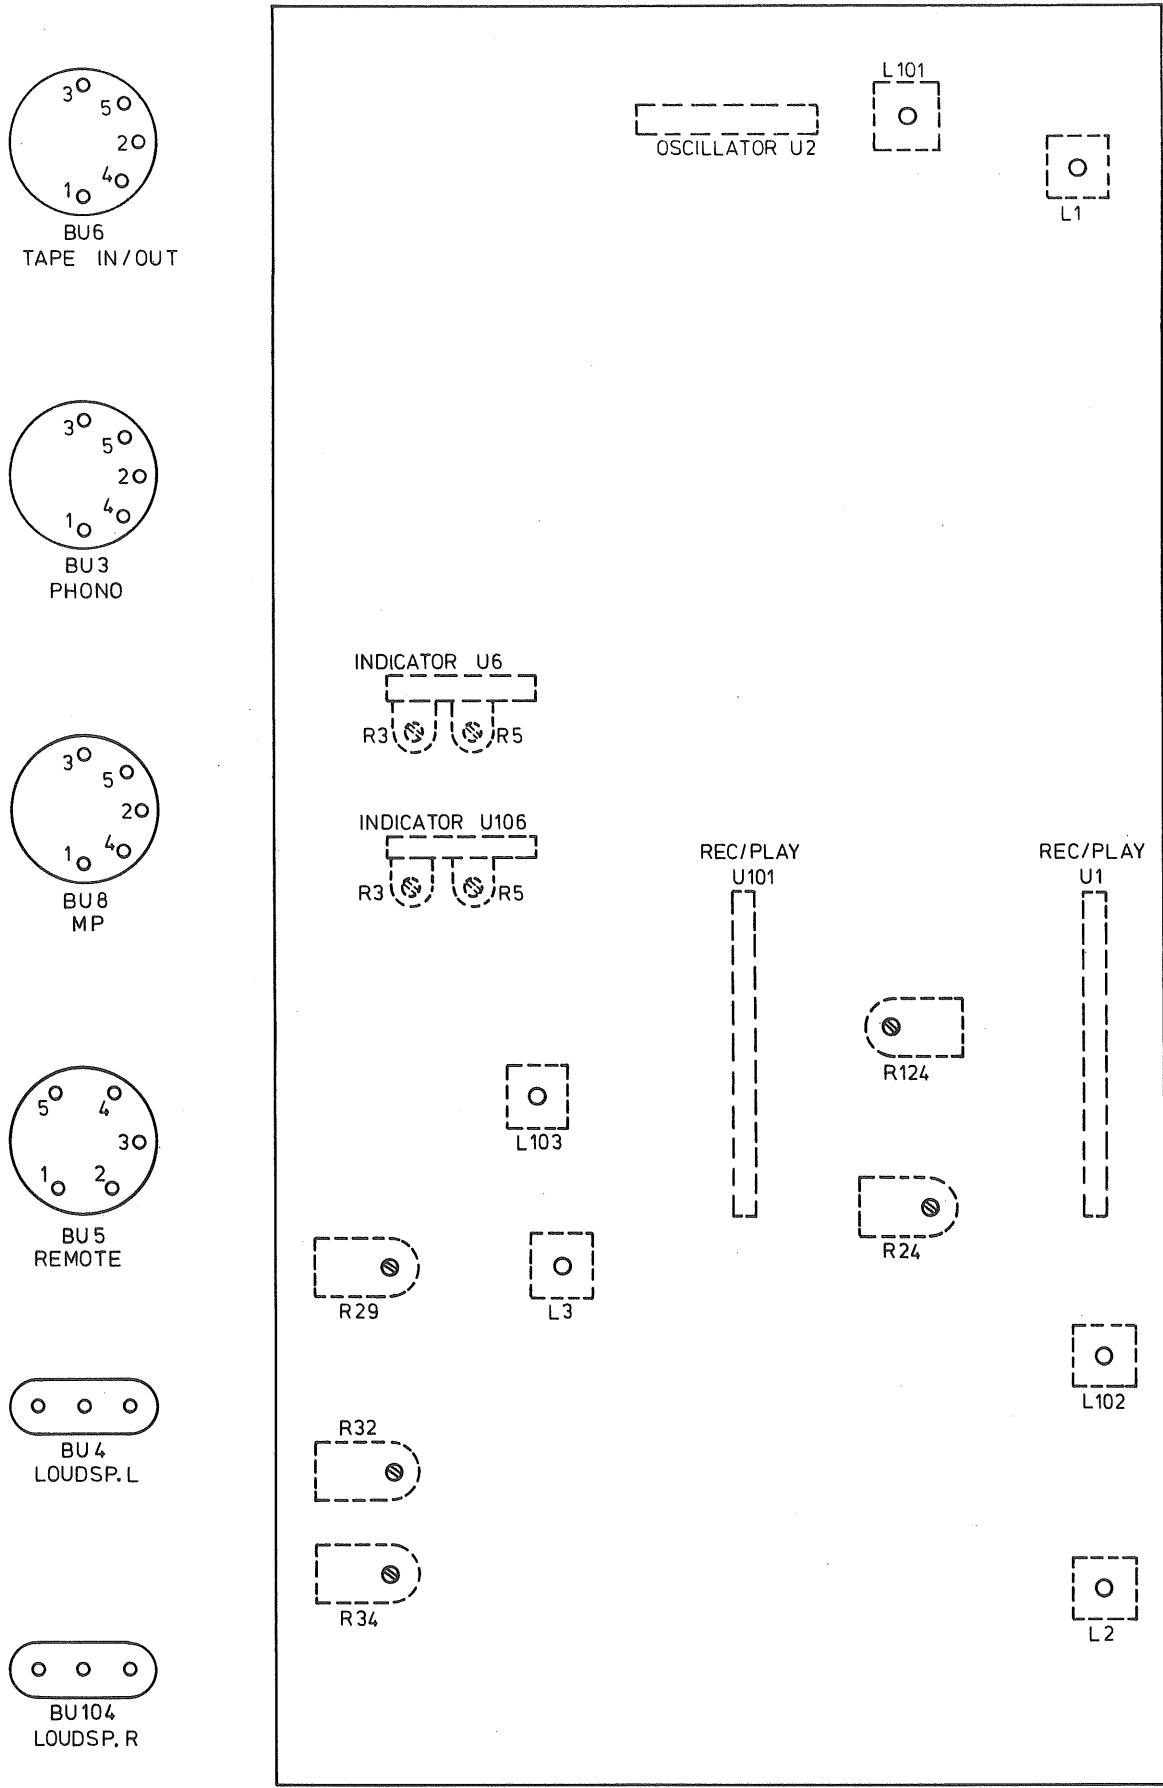

Fig. 9

MECHANICAL ADJUSTMENTS

Required tools and test equipment

- Set of feeler gauges 0.1 - 2 mm
- Spring pressure gauge 30 g
- Spring pressure gauge 1500 g
- Alignment gauge
- Test tape 1 kHz-10 kHz
- Test tape 3150 Hz, 4.75 cm/sec ($1\frac{7}{8}$ i.p.s.)
- Test tape 3150 Hz, 9.5 cm/sec ($3\frac{3}{4}$ i.p.s.)
- Test tape 3150 Hz, 19 cm/sec. ($7\frac{1}{2}$ i.p.s.)
- Stroboscope 50 Hz
- Stroboscope 60 Hz
- "Wow and flutter" meter e.g. Bruno Wälde type ME104.

4822 403 50718
4822 397 30014
8222 305 11170
8222 305 11190
8222 305 11150
4822 395 90001
4822 395 90002

1. Adjusting the recording/playback head (see Fig. 13).

Coarse adjustment

- Remove the head cover 178 and covering plate 129.
- Place the alignment gauge into the recorder as indicated in Fig. 13.
- Adjust the tape guide to the correct height with nut D.
- With screw A and nuts B and C adjust the head so that:
 - a. the top of the upper core of the recording/playback head is flush with the top of the alignment gauge.
 - b. the gauge can slide freely between the guide pins of the erase head and the tape guides
 - c. the front of the head is perpendicular to the mounting plate.

Fine adjustment (with test tape 1 kHz-10 kHz).

- Set the speed selector to position "9,5" and the track selector to position "1-4".
- Adjust the height of the recording/playback head by turning nut B until the reproduction of the 1 kHz signal is just audible above the noise.
- Adjust the azimuth of the recording/playback head by turning screw A until the reproduction of the 10 kHz signal is maximum.

2. Tape path adjustments

For removal of the cabinet, see page 4.

Adjusting the turntables (see Fig. 17)

- Loosen nut 9.
- Adjust the height of the turntable by means of pivot bearing 68 until the tape is centred between the reel flanges.
- Lock the pivot bearing with nut 9.
- Adjust the axial play to 0.1 - 0.2 mm by moving pulley 66 or ring 115.

Adjusting the pulley of the winding motors (see Fig. 29)

- Loosen screws 8 in pulley 62.
- Adjust the pulley so that the groove is at the same height as the groove of the turntable.
- Tighten the screws again and lockpaint them.
- When the belt produces noise, this can be remedied by turning this belt.

Adjusting pinch roller 105 (see Fig. 29)

- Adjust pinch roller 105 with retaining ring 11 so that the axial play is between 0.1 and 0.2 mm.

Adjusting capstan bearing 103 (see Figs. 11 and 29)

For this adjustment it is assumed that the tape guides have been adjusted to the correct height.

- Tighten screws A.
- Insert a DP tape.
- Turn screw B until the tape runs straight between the capstan and the pinch roller.
- Tighten screw C so that the setting is locked.

3. Adjusting the solenoids

For disassembly, see page 4.

Adjusting the pinch roller solenoid (see Figs. 10 and 29)

- When the solenoid is energised, the clearance between bush 112 and the lower nuts 35 on rod 114 should be 0.3 to 0.5 mm. This can be adjusted by turning the lower nuts 35.
- When the solenoid is energised, the force at the top of the pinch roller spindle (110) should be 1000 grammes \pm 100 grammes. This force should be applied at the moment that there is a visual play between the pinch roller and the capstan. This tensile force can be adjusted by turning the upper nuts 35.

- The clearance between pinch roller 105 and capstan 76 should be 10 mm \pm 1 mm when the solenoid is de-energised. To be adjusted by bending tag A.
- When the solenoid is de-energised the contacts of switch 58 should be closed. To be adjusted by bending tag A (see Fig. 14).
- When the solenoid is energised the clearance between the open contacts of switch 58 should be 0.3 - 0.5 mm. To be adjusted by bending the contacts (see Fig. 14).

Adjusting the brake solenoid and the brakes (see Figs. 15, 16 and 29)

- When the solenoid is energised the clearance between the brake shoes on bracket 59 and 73 and the turntables should be 0.6 to 0.7 mm. To be adjusted by bending tags A. Make sure that the clearance on the left and on the right is equal (see Fig. 16).
- When the brake shoes are applied the clearance between tags B and the brake brackets should be 0.2 - 0.3 mm. To be adjusted by bending tags B (see Fig. 16).
- When the brake shoes are reversed (round side of brake shoes against turntables), the clearance between the solenoid armature and the brake brackets (59 and 73) should be 0.3 to 0.4 mm. To be adjusted by bending tag C (see Fig. 16).
- The brake force of the left and right turntable should be 1000 g/cm. This force can be measured by means of a full reel and a spring pressure gauge, as indicated in Fig. 15. The gauge should give the following readings for the various reel diameters:

Reel diameter	Gauge reading
13 cm	175 g
15 cm	150 g
18 cm	125 g

The braking force equals the gauge reading \times radius of the wound tape. To be adjusted by shortening, extending or replacing spring 57 (Fig. 16).

4. Adjusting the tape tension control (see Figs. 12 and 29)

For disassembly, see page 4.

- Switch 58 should make contact in the rest position. To be adjusted by bending the contact springs.
- The clearance between the centre contact of switch 58 and the side of the slot in tape tension sensor 56 should be 0.1 - 0.2 mm in the rest position. To be adjusted by bending tag A (see Fig. 12).
- The force exerted on the pin of the tape tension sensor should be 25 - 30 grammes when the contact just opens. To be adjusted by bending tag B (see Fig. 12).

5. Adjusting the capstan motor (Fig. 29)

For disassembly, see page 4.

- Motor pulley 78 should be at the same height as the core of the pulse head. To be adjusted by loosening screws 16 and adjusting the pulley to the correct height. After this, tighten the screws and lock-paint them.
- The clearance between pulley 78 and pulse head K3 (80) should be 0.15 - 0.2 mm. To be adjusted by loosening screws 17 and moving the head until the clearance is correct. Then tighten and lock-paint the screws.

6. Adjusting the speed (see Fig. 9)

- Hinge up the amplifier board (see page 4).
- Connect the "Wow and flutter" meter to BU6 TAPE IN/OUT: points 3 and earth (5 and earth).
- Play back a test tape with a frequency of 3150 Hz, recorded at 4.75 cm/sec., 9.5 cm/sec. or 19 cm/sec., depending on the speed to be adjusted.
- Now adjust for the correct speed by turning the relevant potentiometer (see Fig. 9 and the table below).

Speed	Potentiometer (see Fig. 9)	Max. speed deviation from test tape
19 cm/sec.	R34	\pm 1 %
9.5 cm/sec.	R32	\pm 1 %
4.75 cm/sec.	R29	\pm 2 %

Note:

The speed can also be adjusted with a stroboscope. Proceed as follows:

- Place the stroboscope next to the recorder and feed the tape around the roller.
- Set the speed selector to the desired speed and adjust for the correct speed with the appropriate potentiometer (see table).

LUBRICATING INSTRUCTIONS

Shell Clavis 17 - 4822 390 10048

Bearings of flywheel 76, turntables 69, tape tension scanner 56 and pinch roller 105.

Attention:

Make sure that the part of the capstan protruding from ring 102 does not become greasy.

Shell Alvania 2 - 4822 389 10001

The various pivots of pressure felt brackets 72, 106, 108, brake brackets 59 and 73, pinch roller lever 110, thrust bearing of turntables 69 and flywheel 76. The pivots of the switch control mechanism, the contact faces of brackets 197, 203, 206 and 211.

Silicone grease - 4822 390 20023

The contact faces of the push-buttons, brackets 191 and 205, spindles 196 and 198 and ball at the slide buttons.

ELECTRICAL CHECKS AND ADJUSTMENTS (Fig. 15)

Required test equipment:

- Multi-meter 40 kΩ/V P81700 or PM2411
- RF milli-voltmeter GM6012 or PM2454
- LF generator GM2317 or PM5105

I. SENSITIVITY OF RECORDING AMPLIFIER

Recorder
in position : "ST" - "NOR" - "4.75".
Button "REC" depressed.
Recording level control "REC" to max.; balance control in mid position; other controls set to minimum.

Input : BU3 PHONO A signal of 333 Hz applied between point 3 and earth (point 5 and earth).

Output : BU8 test points Adjust the generator voltage so that 0.25 mV is measured between point 1 and earth (point 4 and earth). (The generator voltage should then be 13 - 17 mV). This adjustment should be maintained during the next measurements.

Input : BU3 PHONO Adjust the frequency of the generator signal to 40 Hz.

Output : BU8 test points The voltage between point 1 and earth (point 4 and earth) should be 0.28 - 0.46 mV.

Input : BU3 PHONO Adjust the frequency of the generator signal to 8 kHz.

Output : BU8 test points Adjust the voltage between point 1 and earth (point 4 and earth) to 1.5 mV with L2 (L102).

II. AMPLIFIER SENSITIVITY

For this measurement use a new unmodulated tape of very good quality.

Recorder
in position : "ST" - "NOR" - "19". Button "REC" depressed.
Recording level control "REC" in position "6"; balance control in mid position; other controls set to minimum.

Input : BU3 PHONO Apply a signal of 333 Hz between point 3 and earth (point 5 and earth).

Output : BU8 test points Adjust the generator voltage so that 1.6 mV is measured between point 1 and earth (point 4 and earth). Make a recording of the generator signal. When the recorded signal is reproduced, adjust the output voltage on BU6 TAPE IN/OUT, point 3 and earth (point 5 and earth) to 1.2 V with R24 (R124).

III. SUPPRESSION ERASE OSCILLATOR SIGNAL

Recorder
in position : "1-4" ("3-2") - "MP" - "4.75". Buttons "REC" and "PLAY" depressed.
Recording level control "REC" and volume control to max.; other controls to minimum.

Output : BU8 test points Adjust the output voltage between point 1 and earth (point 4 and earth) to minimum with L103 (L3). Seal the core with wax.

IV. FUNCTIONAL UNITS (see Figs. 18 - 21)

U1/U101 RECORDING/PLAYBACK UNIT

This unit requires no adjustment

U2 OSCILLATOR UNIT

Recorder
in position : "ST" - "NOR" - "19".
Buttons "PLAY" and "REC" depressed.
All controls set to minimum.

Input : BU6 TAPE IN/OUT Apply a signal of 1 kHz, 1 V between point 3 and earth (point 5 and earth).

Output : BU8 test points Adjust the output voltage between point 1 and earth (point 4 and earth) to 1.6 mV with recording level control "REC". The deflection of the indicator should be 100%. Remove the core from coil L1 (L101). Slide the core so far into the coil that the output voltage no longer increases. Seal the core with wax. The voltage on the erase head should be 26-40 V.

U6/U106 INDICATOR UNIT

a. Minimum adjustment

Recorder
in position : "ST" - "STOP". All controls set to minimum.
Adjust R3 of U6 (U106) so that the left (right) indicator is slightly above zero.

b. Maximum adjustment

Recorder
in position : "ST" - "NOR" - "19". Button "REC" depressed.
Recording level control "REC" to maximum; balance control in mid position; other controls to minimum.

Input : BU3 PHONO Apply a signal of 333 Hz between point 3 and earth (point 5 and earth);

Output : BU8 test points Adjust the generator voltage so that 1.6 mV is obtained between point 1 and earth (point 4 and earth) (The generator voltage should now be 110-170 mV). Adjust the voltage between point 1 and earth (point 4 and earth) to 0.16 mV with recording level control "REC" (The generator voltage should then be 1.1 - 1.7 mV). Adjust R5 of U6 (U106) so that the left (right) indicator gives 100% deflection (=0dB).

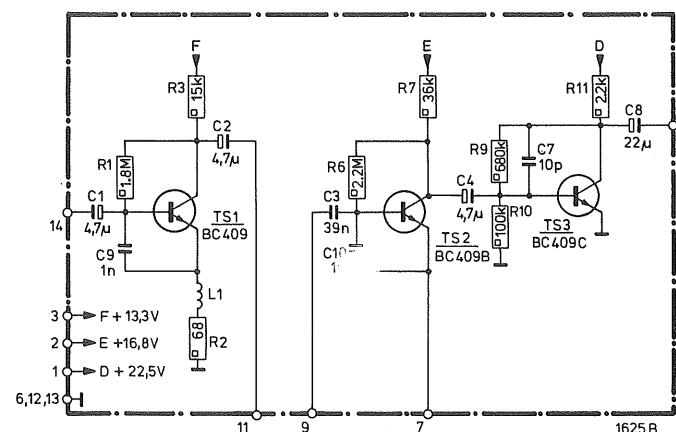

U201 SPEED CONTROL UNIT

This unit requires no adjustment.

U1/U101

RECORDING/PLAY-BACK UNIT

4822 214 30165

WORKING PRINCIPLE OF THE CONTROL SECTION

The control section of N4416 can be divided into 3 parts:

- Control circuit for the reel motors;
- Control circuit for the capstan motor;
- Automatic stop at the end of tape or in zero position of counter.

As soon as button "PLAY" is depressed, the pinch roller solenoid and the brake solenoid are energised. As a result, the pinch roller is pressed against the capstan, the felts against the heads and the brake is released.

The starting torque of the right-hand turntable is increased by the circuit R203, 205 and C202. This is necessary to prevent looping; as the tape is immediately run up to full speed by the capstan motor.

The left reel motor (M1) is energised via R202. This motor provides counter-friction.

Diodes D201 and D217 ensure that no voltage surges arise when the solenoids are de-energised. However, these diodes delay the de-energising of the solenoids. To ensure that they are de-energised at the correct moment, zener diode D216 has therefore been connected in series with D217.

If one of the buttons "REW" or "FFORW" is depressed, the brake solenoid is energised, so that the brake is released.

When button "REW" is depressed the left reel motor (M1) starts to rotate. Via R201, D209, SK701, 703 and D212 voltage is fed to the right-hand reel motor (M2), so that it tends to rotate anti-clockwise. However, the tape pulls it in a clockwise direction: the right-hand reel motor provides the necessary counter-friction.

When the tape tension becomes too high, SK701 opens. As a result, no voltage is applied to the right-hand reel motor: the counter-friction decreases.

When the tape tension decreases, SK701 is closed and the right-hand reel motor is energised again: the counter-friction increases.

During "FFORW" the working is the same, the tape tension is kept constant with SK702.

Capacitors C201, 205, 206 and 207 prevent burning in of the switch contacts.

The speed of the capstan motor is controlled with the aid of "speed control unit" U201.

The pulley of capstan motor M3 is toothed. This toothed pulley and pulse head K3 produce an alternating voltage which is fed to the base of TS1. This voltage is amplified (TS1) and converted to a squarewave voltage (TS2).

The amplitude of this squarewave voltage can be adjusted with resistor R29 for 4.75 cm/sec., R32 for 9.5 cm/sec. and R34 for 19 cm/sec. (see Mechanical adjustments).

The squarewave voltage is differentiated by C2 and R5. Diodes D1 and D2 together with C3 form a rectifier and voltage doubler circuit for the pulses which remain after differentiation of the squarewave voltage.

When there are no pulses which charge the capacitor, TS3 is driven into conduction by voltage A1 via R5, which is negative with respect to the voltage on the emitter. Transistors TS4 and TS701 then also become conductive and motor M3 tends to rotate at full speed. However, as soon as the motor rotates head K3 supplies an alternating voltage which after differentiation provides the negative pulses by which C3 is charged. TS3 then becomes less conductive, thus maintaining a constant motor speed.

Diode D3 protects TS3.

Resistor R210 and diode D215 limit the motor current.

The recorder stops automatically at the end of the tape or in position zero of the counter when button "PLAY" and the counter switch (SK12) have been depressed. In position playback or fast winding the emitter of TS201 receives a positive voltage. As a result, the transistor cuts off and solenoid RE1 de-energises.

If:

- the switching tape short circuits the tape contact (= metal part of the right-hand tape tension scanner), or
 - the counter reaches the zero position when buttons "PLAY" and SK12 have been depressed,
- the base of TS201 becomes negative so that TS201 is turned on, and energises solenoid RE1. All buttons are then released and the recorder stops.

D214 prevents voltage surges while the solenoid is de-energised.

LIST OF MECHANICAL PARTS

Control mechanism

3	Screw M2, 5x10	4822 502 10814
6	Screw M3x4	4822 502 11069
11	Retaining ring 3	4822 530 70115
12	Ring 3,2x5,5x0,2	4822 532 10332
13	Screw M3x10	4822 502 10689
28	Screw M2x4	4822 502 11059
31	Screw M3x6	4822 502 11064
36	Retaining ring 1,5	4822 530 70121
38	Retaining ring 4	4822 530 70116
42	Ring 2,8x7x0,5	4822 532 10215
48	Screw 2,9x12,3	4822 502 30081
49	Self-tapping screw	4822 502 30001
140	Relay (RE1)	4822 280 60369
170	"STOP" button assy.	4822 410 40025
171	"REC" button assy	4822 410 40031
172	"PAUSE" button assy	4822 410 40029
173	"PLAY" button assy	4822 410 40028
174	"F FORW" button assy	4822 410 40027
175	"REW" button assy	4822 410 40026
191	Bracket	4822 403 50713

192	Rubber wedge	4822 466 90771
193	Bracket	4822 403 50716
194	Pressure spring	4822 492 50991
195	Leaf spring	4822 492 61813
196	Spindle	4822 535 90901
197	Catch	4822 403 50714
198	Spindle	4822 535 90898
199	Stop bracket	4822 503 50675
200	Tension spring	4822 492 31087
201	Spindle	4822 535 90899

Tape deck

1	Screw M3x5	4822 502 10558
2	Ring	4822 532 50043
3	Screw M2,5x10	4822 502 10814
4	Self-tapping screw 2,9x6,5	4822 503 30084
5	Screw M2x5	4822 502 10679
6	Screw M3x4	4822 502 11069
7	Ring 4,2x8x0,5	4822 532 50725
8	Screw M3x6	4822 502 11107
9	Nut M5	4822 505 10513
10	Retaining ring 2	4822 530 70114
11	Retaining ring 3	4822 530 70115
12	Ring 3,2x5,5x0,2	4822 532 10332
13	Screw M3x10	4822 502 10689
14	Ring 3,1x5,6x1	4822 530 80082
15	Curved washer 4,2x9x0,1	4822 530 80076
16	Screw M1,6x6	4822 502 11258
17	Screw M2x8	4822 502 10681
18	Nut M2,5	4822 505 10464
19	Nut M2	4822 505 10397
20	Ring 3,2x5,5x0,45	4822 530 70123
21	Nut M2,5	4822 505 10471
22	Screw M2,5x12	4822 502 11055
23	Ring 4,2x7x0,9	4822 530 80163
24	Screw M4x50	4822 502 10696
25	Screw M3x18	4822 502 10559
26	Ring 3,2x9x1	4822 532 10582
27	Screw M3x15	4822 502 10691
28	Screw M2x4	4822 502 11059
29	Selftapping screw 2,9x9,5	4822 502 30103
30	Screw M3x20	4822 502 11004
31	Screw M3x6	4822 502 11064
